Title: Ocular Manifestations of HIV/AIDS in Children

IRB# 2012-014
Principal Investigator: Susan Day, MD

Synopsis:

Literature regarding the ocular manifestations of HIV/AIDS in children is limited. Current studies suggest not only are the ocular aspects of HIV infection less common in children than adults, but there may be specific associated retinal changes specific to the pediatric population.

The goals of this study are to identify and characterize the effects of HIV/AIDS in a pediatric cohort by both chart review and ocular examination of patients receiving care through the Infectious Disease department’s Pediatric HIV/AIDS program under the direction of Dr. Ann Petru.
